RJG, Inc. Upgrades Process Controller Software

RJG has completed a round of upgrades to their *eDART* System™ software. The engineering team at RJG is always working on ways to improve the performance of the *eDART* System™ and to simplify it's use. The 8.5 release will support the newly released *eDART flx*, RJG's short shot containment system.

The additional software features for the *eDART* System are:

Auto-Set Fill Volume

The Auto-Set Fill Volume is an improved method of establishing a fill volume without user input.

Excessive Rejects Tool

The system can generate a signal in response to a user specified number of reject cycles.

Check out our web site at www.rjginc.com for detailed software information.
