

PRESS RELEASE

26/03/2008

OVER 40 YEARS OF ACTIVITY

To celebrate its "first 40 years" of activity, MOSS srl of Reggio Emilia (www.moss.it), Italy has recently presented **Accur8**, the newest innovative technology marvel, featuring a 9-colour or 8-colour silk-screen printer + lacquering for decoration on plastic flexible tubes.

The notable expertise of MOSS technicians due to over 40 years of machine design and construction, allowed to weld the great mechanical knowledge, developed by building silkscreen printers of absolute successes, such as MS 1030 and MS 1035, together with new technologies available in the current market place.

The **Accur8** is made of a high precision rotary indexer with 24 mandrels. In order to avoid slippage of flexible tubes on these mandrels, they have been connected to a revolutionary new suction system. Each printing module is driven by a linear motor which works synchronized with the mechanical rotation of tubes. The format change-over is very quick, thanks to the computerized automatic self set-up and to the mandrel "quick change" which does not need the use of any tools, (it can be carried out totally by hand). When the diameter of the tubes changes, it is no longer necessary to change the gears for tube rotation during printing.

In the market of decorated plastic buckets MOSS has instead widened its broad range of products with a new 8-colour offset printer, called **MO 4083/8**, for the execution of very high quality printings. The possible coupling with a lacquering machine **MP8-LAC** with onmandrel UV drying allows to obtain direct printings of significant quality and intense bright and deep colours. In spite of the dimensions of its printing head, thanks to the exclusive design adopted by MOSS technicians, i.e. groups of colours divided in a 4 + 4 combination, the operator of the machine can work very simply on all of the 8 colours available making them very accessible and user friendly.
